Exercise 5a

Simulate the lifecycle stages for UI design using the RAD model and develop a small interactive interface using Axure RP

1.AIM:

The aim is to demonstrate the lifecycle stages of UI design via the RAD model and develop a small interactive interface employing Axure RP**.**

2. PROCEDURE:

RAD Model (Rapid Application Development):

The RAD model is a software development methodology that emphasizes quick development, iterative design, and user feedback. It focuses on rapid prototyping rather than extensive planning.

Phases of RAD Model:

1. Requirements Planning:
   Gathering requirements and identifying system features.
2. User Design:
   Creating prototypes and refining UI based on feedback.
3. Construction:
   Developing the actual system and testing it iteratively.
4. Cutover:
   Final deployment, testing, and user training

3. REQUIREMENTS PLANNING:

Identified Features:

- Home screen with search and categories
- Product listing and product details
- Add to cart functionality
- Checkout and order confirmation

User Actions:

- Browse products
- View product details

- Add items to cart
- Checkout and confirm order

User Story:

"As a user, I want to browse products and add them to my cart so that I can purchase them easily."

4. USER DESIGN:

Tool Used:

Axure RP

Wireframes Created:

- Home Screen
- Product Details Screen
- Cart Screen
- Checkout Screen
- Order Confirmation Screen

Design Description:

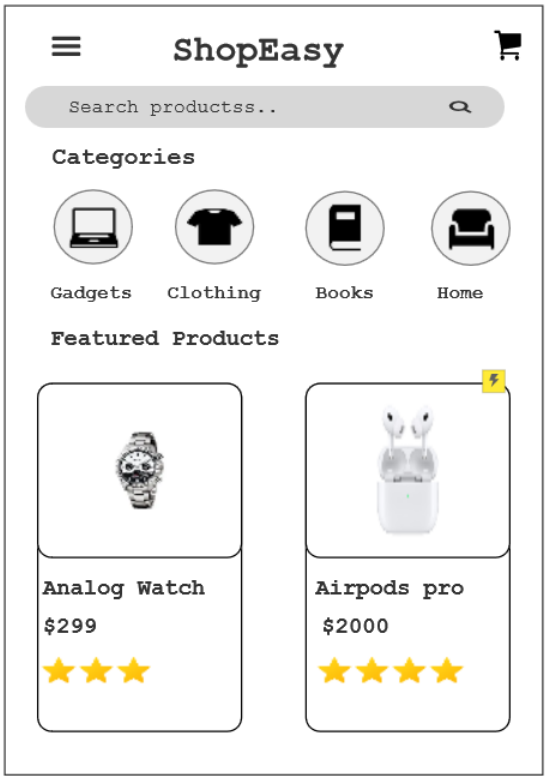
- The Home screen contains navigation menu, search bar, categories, and featured products.
- Product details page displays product image, description, rating, and add-to-cart option.
- Cart page shows selected items and total cost.
- Checkout page includes user details and payment options.
- Confirmation page shows successful order placement.

5.INTERACTION DESIGN:

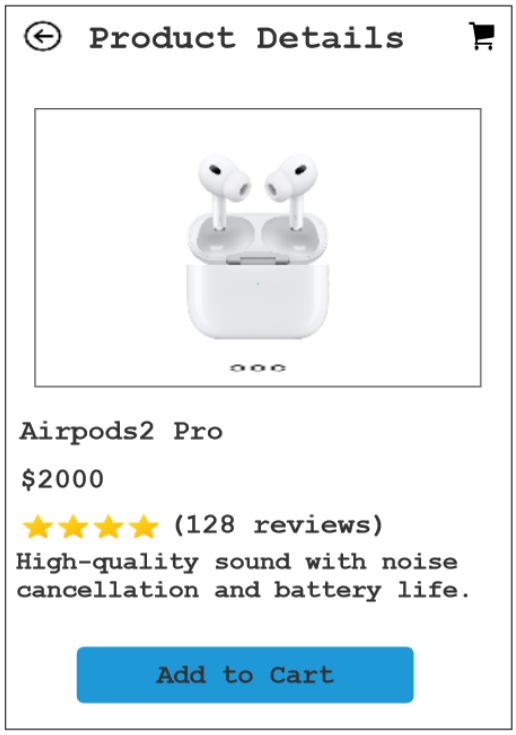
Interactive navigation was implemented using Axure RP:

- Product selection → navigates to Product Details page
- "Add to Cart" button → navigates to Cart page
- "Checkout" button → navigates to Checkout page
- "Place Order" → navigates to Confirmation page

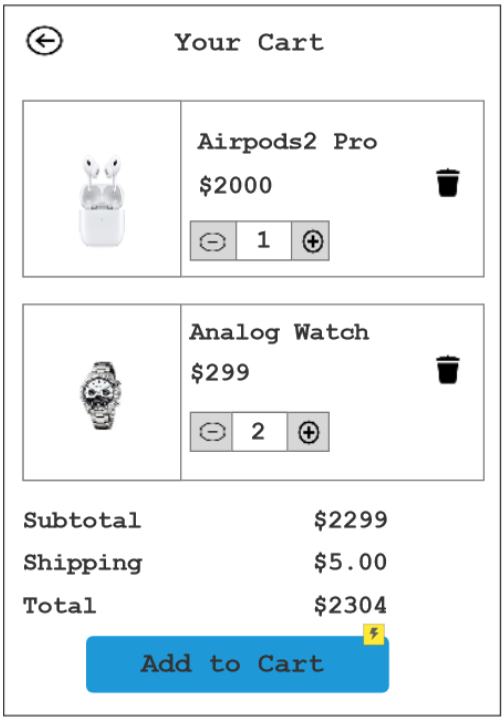
1.HOME SCREEN



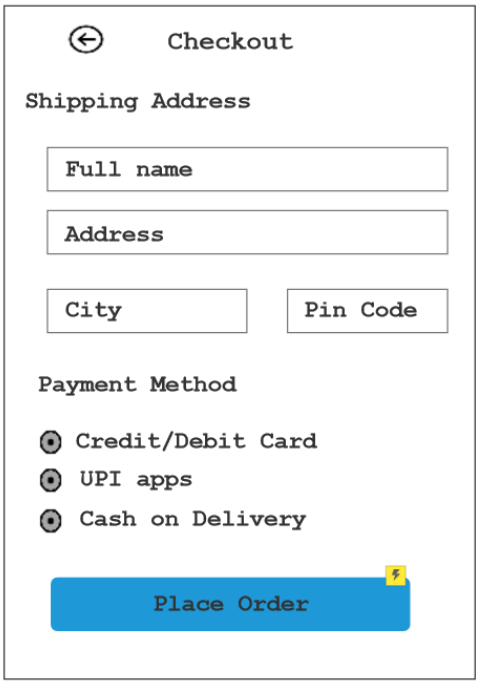
2.PRODUCT DETAILS



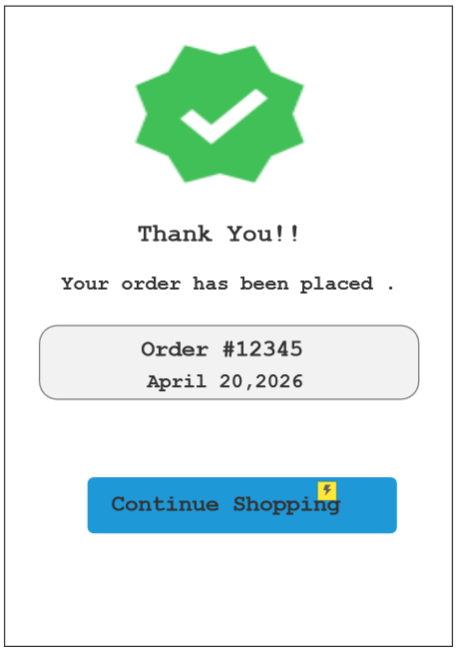
3.CART SCREEN



4.checkout screen



5.order placed screen



RESULT:

Thus, the lifecycle stages of UI design using the RAD model were successfully simulated, and an interactive shopping application interface was developed using Axure RP.

Exercise 5b

Simulate the life cycle stages for UI design using the RAD model and develop a small interactive interface using OpenProj

AIM:

The aim is to recreate the lifecycle stages of UI design using the RAD model and design small interactive interface with OpenProj.

PROCEDURE:

Step 1: Requirements Planning

1. Gather Requirements:

○ Identify key features and functionalities needed for your interface.

○ Example: A simple "Login" and "Register" interface with debug logs.

2. Define Use Cases:

○ Specify use cases for user login and registration.

○ Example: User logs in with valid credentials, user registers with a new account.

Output in OpenProj:

● Create a new project.

● Add tasks: "Gather Requirements" and "Define Use Cases."

● Set durations and dependencies for each task.

Step 2: User Design

1. Sketch Initial Designs:

○ Draw rough sketches of the "Login" and "Register" screens on paper.

2. Create Digital Wireframes:

○ Use a tool like Figma or Sketch to create digital wireframes.

Example Wireframes:

1. Login Screen: Username field, Password field, Login button, Register link.

2. Register Screen: Username field, Email field, Password field, Confirm Password

field, Register button.

Output in OpenProj:

● Add tasks: "Sketch Initial Designs" and "Create Digital Wireframes."

● Allocate time and resources to complete these tasks.

Step 3: Rapid Prototyping

1. Develop Prototypes:

○ Use a tool like Axure RP to convert wireframes into interactive prototypes.

2. Test Prototypes:

○ Share prototypes with stakeholders for feedback.

○ Collect feedback and iterate on the design.

Output:

● Interactive prototypes for "Login" and "Register" screens.

Output in OpenProj:

● Add tasks: "Develop Prototypes" and "Test Prototypes."

● Set dependencies and milestones.

Step 4: User Acceptance/Testing

1. Review Prototype:

○ Conduct user and stakeholder reviews.

2. Conduct Usability Testing:

○ Perform usability testing and document feedback.

Output:

● Documented feedback and test results.

Output in OpenProj:

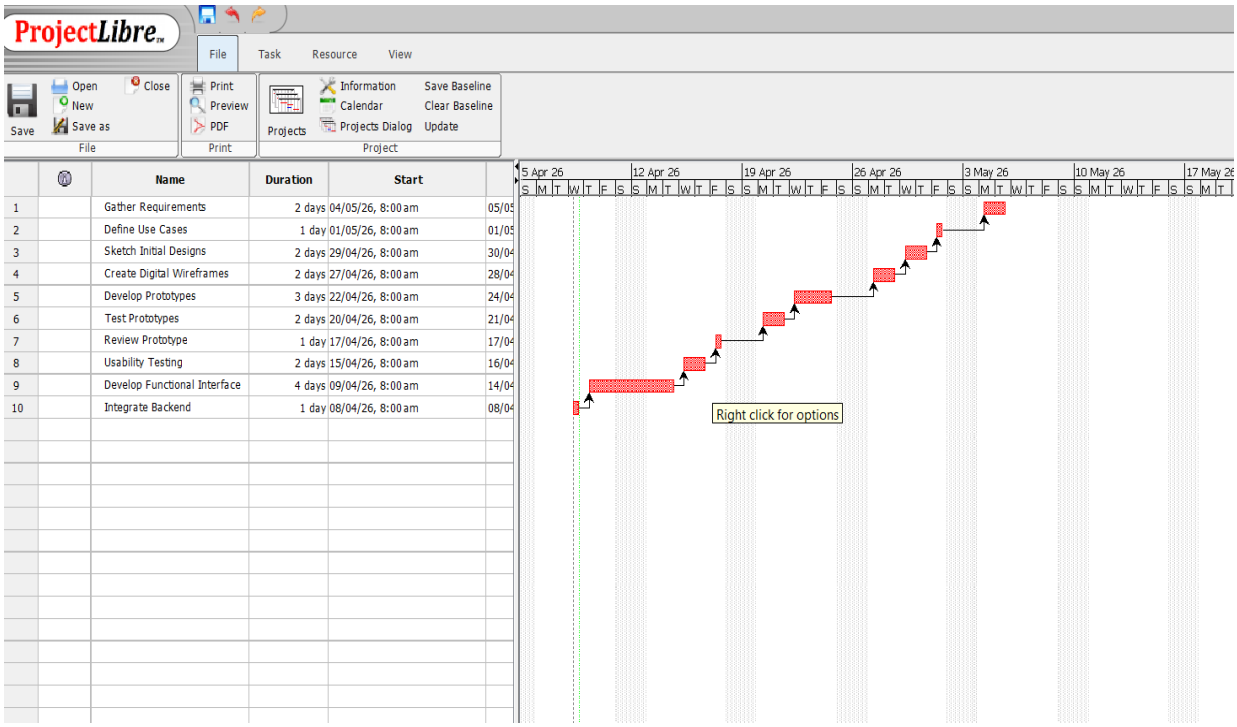
● Add tasks: "Review Prototype" and "Usability Testing."

● Track progress and resources.

Step 5: Implementation

1. Develop Functional Interface:

○ Implement final designs and functionalities based on feedback.



CONCLUSION

The experiment helped in understanding how the RAD model enables quick development and continuous feedback. The use of OpenProj helped in effective planning and visualization of the project timeline.
